

Do you have a video you need to make smaller?

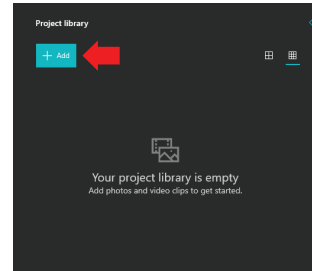

Step 1.

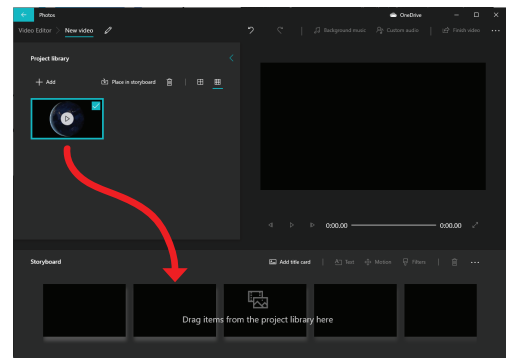

Open the start menu and navigate to the **Video Editor** program, open the **Video Editor**. Click on **New Video Project** and name your video to get started.

Step 2.

Click on **Add** and select your video from the file explorer.

Click and drag your video from the **Project Library** and drop it onto the **Storyboard**.

Step 3.

Once your video is on the **Storyboard**, click on **Finish Video**. A window will popup that will allow you to select **High**, **Medium**, or **Low**.

Step 4.

Select **Medium** and then click on **Export**. Save your new compressed video to your desired location.

Your video should now be a smaller file size! If it's still not small enough, start the process again, but select **Low** when exporting.
